

**Correct Installation & update Steps :**

- Upload the ZIP files of the extensions and themes to the main project directory, then extract them.
- Upload the file Extensions-Table-v9.1.sql.
- Go to: [yourdomain.com/update-manual](http://yourdomain.com/update-manual).
- To activate the themes, change the theme name in app\_settings.

Never use the included SQL files related to the extensions unless absolutely necessary — they are only meant to be used if the database tables were accidentally deleted.
